

PocketSmart AI

Project Testing Phase

1. Testing Overview

PocketSmart AI was tested to verify that the application works correctly and provides suitable budget-based recommendations.

2. Testing Objectives

- Verify all major features work correctly.
- Check user input validation.
- Test planner modules.
- Test recommendation generation.
- Verify fallback functionality.
- Identify and fix errors.

3. Functional Testing

Test Case	Expected Result	Status
User registration	New user account is created	Passed
User login	Valid user can log in	Passed
Home Planner	Home recommendations are generated	Passed
Party Planner	Party recommendations are generated	Passed
Jewelry Planner	Jewelry recommendations are generated	Passed
Budget input	Budget is accepted and processed	Passed
Invalid input	Validation prevents incorrect input	Passed

Fallback
recommendations

Results are provided when AI is
unavailable

Passe

4. AI Testing

The recommendation system was tested with different budgets, preferences and planning requirements. The system was also tested when the Gemini AI service was unavailable.

5. Usability Testing

The website pages, navigation, forms and recommendation results were checked for ease of use and clarity.

6. Compatibility Testing

The application was tested in a modern web browser and checked for responsive behaviour on different screen sizes.

7. Error Handling

The system handles invalid inputs and AI service failures using validation and fallback recommendations.

8. Testing Result

The major modules of PocketSmart AI were tested successfully. The Home Planner, Party Planner, Jewelry Planner, authentication and fallback recommendation features function as expected.

9. Conclusion

Testing confirmed that PocketSmart AI meets the main functional requirements and can provide budget-based recommendations through its web interface
