

PocketSmart AI

Brainstorming & Idea Prioritization

Project Idea: PocketSmart AI is a smart budget and recommendation assistant that helps users plan spending and receive suitable recommendations for home decor, party planning, and jewelry based on their budget and preferences.

1. Brainstorming

Idea	Description
Budget Planner	Help users plan spending according to an available budget.
Home Decor Assistant	Suggest affordable home decor items based on room type and style.
Party Planner	Suggest party items according to event type, guest count, theme and budget.
Jewelry Recommendation	Suggest jewelry based on occasion, jewelry type and budget.
Product Comparison	Compare products from different shopping platforms.
AI Shopping Assistant	Use generative AI to provide personalized recommendations.

2. Idea Evaluation Criteria

- **User usefulness:** The solution should solve a practical budgeting or shopping problem.
- **Technical feasibility:** The project should be achievable using Python, FastAPI, SQLite and generative AI.
- **Personalization:** Recommendations should consider user inputs such as budget and preferences.
- **Scope:** The idea should be suitable for an academic project and demonstrable through a web application.
- **Future scalability:** The design should allow additional recommendation categories and services later.

3. Prioritization

Idea	Usefulness	Feasibility	Personalization	Priority
Budget + AI Recommendation Assistant	High	High	High	Selected
Product Comparison	High	Medium	Medium	Later
Generic Shopping Assistant	Medium	Medium	High	Later
Standalone Budget Calculator	Medium	High	Low	Later

4. Selected Project Idea

PocketSmart AI: Your Smart Budget & Recommendation Assistant was selected as the project idea. The system combines budget planning with AI-assisted recommendations for home decor, party planning and jewelry. The selected idea provides a clear user problem, practical inputs and measurable outputs while remaining suitable for a web-based academic project.

5. Expected Outcome

The final system should accept user requirements and budget information, generate relevant recommendations, present the results clearly through a responsive web interface, and provide a foundation for future enhancements such as more categories, product links and improved AI responses.
