

PocketSmart AI

Project Demonstration

1. Demonstration Overview

The demonstration showcases the working features and functionality of the PocketSmart AI web application.

2. Project Introduction

PocketSmart AI is a GenAI-powered budget and recommendation assistant that helps users plan home decor, parties and jewelry according to their budget and preferences.

3. Demonstration Steps

Step 1 – Homepage

Show the PocketSmart AI homepage and explain the three available planners.

Step 2 – User Registration

Demonstrate the user registration process.

Step 3 – User Login

Demonstrate login using registered user credentials.

Step 4 – Home Decor Planner

Enter the budget, room type, style and requirements. Generate and display recommendations.

Step 5 – Party Planner

Enter the budget, event type, number of guests and theme. Generate and display recommendations.

Step 6 – Jewelry Planner

Enter the budget, occasion and jewelry type. Generate and display recommendations.

Step 7 – Recommendation Results

Show recommended items, estimated prices and recommendation reasons.

Step 8 – Fallback Functionality

Demonstrate that fallback recommendations can be provided when the AI service is unavailable.

Step 9 – GitHub Repository

Show the public GitHub repository and the eight project phase folders.

4. Technologies Demonstrated

- Python
- FastAPI
- HTML
- CSS
- JavaScript
- Jinja2
- SQLite
- Google Gemini API
- GitHub

5. Demonstration Outcome

The demonstration verifies that PocketSmart AI provides functional budget-based recommendations through its web interface for home decor, party planning and jewelry.

6. Conclusion

The completed project demonstrates the integration of web development, database management and Generative AI to create a practical budget and recommendation assistant.
